James Bruce & Tanner Nielsen

- The dataset or datasets you plan to use and how you will obtain them
    - For our project, we are planning to combine data from four sources. They are Wikidata for matching movies to films, TMDB (The Movie Database) for film information, and Open Library and Hard Cover for book information. The collection methods are as follows:
        - SPARQL Query through Wikidata Query Service
        - API calls for TMDB, Open Library, and Hard Cover
- The main question or questions you hope to investigate
    - Do higher rated books lead to higher rated film adaptations?
    - How is this affected by (or affect) things such as: book/film length, time between releases, box office budget/earnings?
- The types of cleaning, analysis, or visualization you plan to perform
    - Cleaning could include standardizing scores, removing missing data, creating inflation adjusted revenue/budget metrics.
    - Our analysis and visualization will likely include exploring the relationship between movie and book ratings, visualizing profit margins and budget for books that have done well.
- The types of functions you expect to develop in your Python package
    - Functions that take as input either basic film or book information, which will then query the data / do an API call to get information on it.
- How the package will support or improve your analysis
    - Our package will help us automate repetitive tasks and allow for reproducibility of the analysis.
- How responsibilities will be divided among group members
    - James: find the data sources (done), visualize data
    - Tanner: clean data, complete statistical analysis
- Potential challenges involving the data, package development, analysis, or project scope
    - From our preliminary data collection, it appears that one of the issues we will need to address is the missingness of the data. Since some values are omitted that could alter the results of our analysis, we will have to decide what is most important.
- Why you believe the project can be completed within six weeks
    - The most time consuming part will be compiling and cleaning the data, which we have a good foundation on so far, after that the analysis shouldn’t take too long.
